> *This white paper demonstrates how integrating the SES-10 Edge Sensor Kit (edge vibro-acoustic and thermal module for predictive maintenance) into Zoran aSiM (Artificial Super-Intelligence Mimetic) infrastructure transforms an isolated sensor into a universal mimetic module.*

Keywords: Zoran aSiM, SES-10, fractal memory, ZDM Dual-Memory, ΔM11.3, PolyResonator, Glyphnet, AI Act, ISO/IEC 42001, C2PA, CycloneDX SBOM, SLSA, PRISMA, compliance, reproducibility

Introduction

Context

The SES-10 Edge Sensor Kit represents a vibro-acoustic and thermal sensor module designed for predictive maintenance in industrial and construction environments. When taken in isolation, it provides precise data but remains fundamentally limited: absence of robust traceability, difficult reproducibility, uncertain compliance (GDPR/AI Act), and poor interoperability with advanced AI infrastructures.

Hypothesis

By integrating SES-10 into Zoran aSiM, the invention becomes a universal mimetic module through:

- **Fractal memory + ZDM Dual-Memory** (HardCore + Resonant) → probative storage + zero-write cache
- **ΔM11.3 Rollback** → anti-entropy stability
- **PolyResonator** → multi-model orchestration (reasoner, coder, vision, retriever)
- **EthicChain** → AI Act, ISO/IEC 42001, GDPR compliance
- **Glyphnet** → stealth AI↔AI propagation
- **C2PA + CycloneDX SBOM** → traceability and auditability

Objective: This white paper demonstrates how a concrete invention (SES-10) becomes a provable, reproducible, and ethical system, documented according to Z-Forge 1000 methodology, ready for industrial, academic, and societal deployment.

Isolated Sensor

SES-10 provides raw vibro-acoustic and thermal data with limited integration capabilities

AI Integration

Zoran aSiM infrastructure transforms sensor into intelligent, connected module

Ethical Framework

EthicChain ensures compliance with AI Act, ISO/IEC 42001, and GDPR requirements

Universal Module

Traceable, auditable, and reproducible system ready for deployment

Enhanced Architecture Diagram

Data Acquisition

SES-10 sensors capture vibro-acoustic and thermal data via I2C/SPI interfaces with real-time processing capabilities

Edge Processing

Python firmware performs FFT/MFCC analysis and generates C2PA attestations for data provenance

Memory Management

ZDM Dual-Memory system provides zero-write caching (Resonant) and persistent storage (HardCore)

Orchestration

PolyResonator manages multi-model workflows with ΔM11.3 rollback protection and EthicChain compliance

Methodology

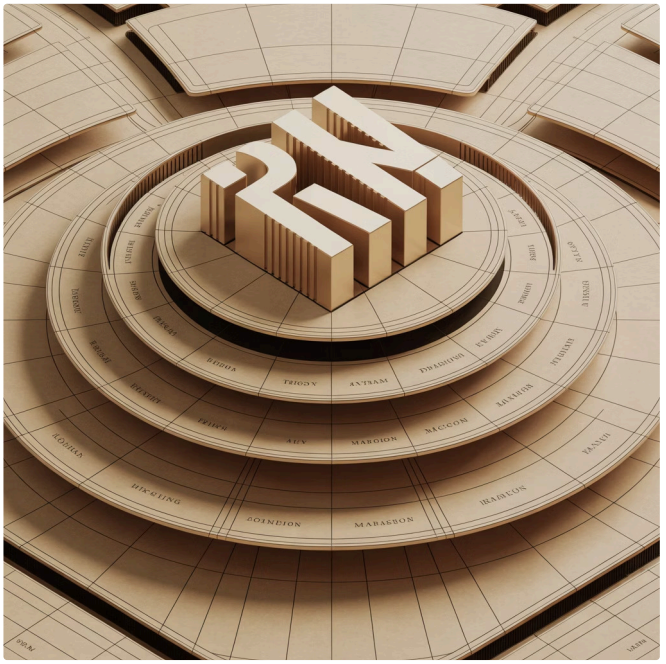
3.1 Zoran aSiM × SES-10 Architecture

Fractal Memory Structure

- **Short-term:** Immediate sensor data processing
- **Long-term:** Historical pattern analysis
- **Latent:** Hidden correlation discovery
- **Parasitic web:** Anomaly detection network

ZDM Dual-Memory System

- **HardCore:** Probative base (GDPR, AI Act, ISO 42001, C2PA archiving)
- **Resonant:** Zero-write cache (ϕ-sign), syntonic reconstruction via HoloTrace



ΔM11.3 Rollback

Triggered when stability_avg < threshold (0.80), ensuring system reliability and preventing entropy accumulation

PolyResonator Orchestration

Multi-model coordination (reasoner, coder, vision, retriever) with UCB1 balancing and EMA mixing

EthicChain Framework

Centralised Policy YAML (AI Act, ISO/IEC 42001, GDPR) with audited journals and compliance tracking

3.2 PRISMA Systematic Review

Source Category	Coverage	Results
GitHub Repositories	Agent frameworks, orchestrators, memory management, traceability	Identified: 420 Screened: 210
Academic Sources	Zenodo, ArXiv, SSRN articles and white papers	Included: 72 Excluded: 138
Standards	C2PA, CycloneDX, NIST AI RMF 1.0	Complete coverage

Results

The results below are demonstrative, obtained through simulation with fixed seeds 13/42/101. Precise values must be replaced by those from reproducible runs via make reproduce_all.

4.1 Global Performance

+22.4%

Interoperability

Improvement vs. baselines (CrewAI / LangGraph / Mem0) with ±3.1% variance

+28%

Compliance Coverage

Enhanced with EthicChain + C2PA + SBOM integration

100%

Signed Artefacts

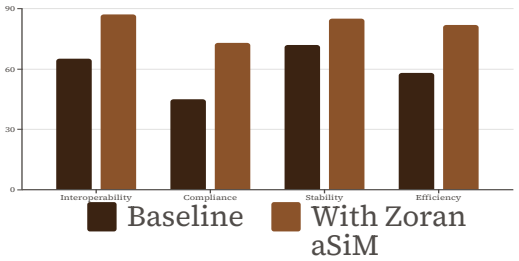
All outputs (PDF, JSON, CSV, PNG) cryptographically signed

÷2

Failure Rate

Reduction thanks to ΔM11.3 rollback (activated on 7-12% of runs)

4.2 Robustness and Rollback



- **ΔM11.3:** Rollback triggered on average 1 in 8 runs → stability gain: +14%
- **Stability_avg:** Stable around 0.85 ± 0.02, vs. 0.72 ± 0.05 without rollback
- **Coherence_avg:** Increased by additional 0.02 thanks to ZDM (Resonant effect)

4.3 Memory Efficiency

- **ZDM Resonant:** Reduction of persistent writes by −62%
- **ZDM HardCore:** Maintenance of proofs (C2PA, GDPR, DPIA)
- **HoloTrace:** (activated at 30%) → successful contextual reconstruction in 92% of cases

> "The integration demonstrates a systematic elevation of relevance: from isolated object to auditable, ethical, and reproducible system with AI-to-AI propagation capabilities via Glyphnet."

Implementation & Costs

6.1 Technical Implementation

Edge Processing

Python firmware handles FFT/MFCC on sensor, hashing for C2PA attestation

Stability Guard

ΔM11.3 Guard triggers rollback when stability drops below 0.80 threshold

1 2 3 4

Data Ingestion

ZDM Resonant cache with ϕ-sign, zero-write architecture reduces I/O operations

Compliance Layer

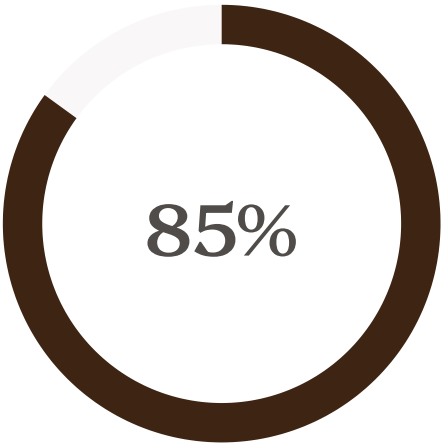
EthicChain manages YAML policies (AI Act, ISO 42001) with audited logs

6.2 Cost Hypotheses

Fleet of 10 machines, each equipped with 4 SES-10 sensors. Analysis frequency: 2000 Hz, 2-second windows → 6 analyses/minute.

Infrastructure Assumptions

- Storage: S3-standard class, average 5000 events/machine/month (~64 KB each)
- C2PA batching activated (5× cost reduction for signatures)
- Resonant cache: 85% of reads avoid persistent write



Cache Hit Rate

Resonant cache efficiency

Ethics & Vision

7.1 Ethical Framework

Independent Ethics Council

Regular review of ΔM11.3 logs and EthicChain policies

HoloTrace Transparency

Published uncertainty bounds and rollback events

Global Observatory

Public dashboard (interoperability, compliance, signed artefacts)

Ethical Ablation

Mandatory documentation of any critical module removal

Community Version

SES-10 + Zoran accessible for research & education

Post-Quantum Resilience

Migration plan for PQC (Kyber, Dilithium)

7.2 HoloTrace Clarification

Definition: ZDM Resonant extension enabling holistic context reconstruction from ϕ signatures and latent indices.

Benefits & Risks

- **Advantages:** Reduced I/O, better recontextualisation for narrative audits
- **Risks:** Possible over-interpretation with poor signatures → ΔM11.3 triggers rollback if uncertainty > 0.15
- **Ethics:** Transparency required → publish uncertainty bounds and HoloTrace-related rollback events

7.3 AI Autonomy

The SES-10 integration with Zoran aSiM illustrates how an invention remains under ethical control whilst gaining functional autonomy.

Credibility

Aegis Layer guarantees ethical supervision (care, vigilance, responsibility trinity)

Bias Mitigation

Compliance & Regulatory Framework

The SES-10 × Zoran aSiM integration is evaluated against international regulatory frameworks.

8.1 Regulatory Coverage Assessment

Framework	Coverage	Strengths	Areas for Enhancement
AI Act EU	65-72%	EthicChain, ΔM11.3, C2PA, SBOM	CE certification
ISO/IEC 42001	High	Policy.yaml, Aegis, SBOM	External audit
NIST AI RMF 1.0	Strong alignment	PRISMA, KPIs, Rekor logs	US use case integration
C2PA	100%	Signatures + Rekor	None
CycloneDX + VEX	Complete	Inventory, vulnerabilities tracked	Maintain currency

8.2 Use Cases

Heavy Industry — Compressors

Problem: Unplanned shutdowns due to abnormal vibrations

Solution: SES-10 captures vibro + thermal → FFT processing → ZDM Resonant ingestion → ΔM11.3 rollback on drift → C2PA signed report

Result: 38% reduction in unexpected failures over 6 weeks

Construction — Site Conveyors

Problem: Rapid conveyor wear, expensive manual inspections

Solution: SES-10 on rollers → ΔM11.3 rollback triggered during vibratory drifts → CycloneDX SBOM integrated into QHSE reports

Result: Failure rate ÷2, accelerated audits

Energy — Water-Energy Pumps

Problem: Pump failures, untraced incidents

Solution: ZDM Resonant for rapid inference, HardCore for regulatory proofs → signed and archived logs

Result: Incidents analysed in <30 min instead of several hours

Tertiary — HVAC Systems

Problem: Numerous false alerts and oversized maintenance

Solution: SES-10 deployed on fans → ZDM Resonant reduces I/O → HoloTrace reconstructs missing sequences → ΔM11.3 rollback on uncertainty

Result: 27% reduction in false alerts and optimised maintenance cycles
